

SUMMARY

The Sales Performance Analysis Dashboard is an Excel-based mini project created to analyze and visualize retail sales data effectively. The main objective of this project is to provide meaningful insights into business performance using interactive charts, pivot tables, and slicers. The dashboard presents important metrics such as quantity sold, profit analysis, discount distribution, and regional sales performance in a simple and visually appealing manner.

This project helps in identifying top-performing regions, profitable product categories, and sales trends across different areas. Various Excel features such as Pivot Tables, Pivot Charts, conditional formatting, and data filtering techniques were used to transform raw data into an interactive analytical dashboard. The project also improves the understanding of customer purchasing patterns and the impact of discounts on overall sales and profit.

The dashboard demonstrates practical skills in Microsoft Excel, data visualization, business analytics, and reporting. It showcases the ability to clean, organize, and analyze large datasets to support business decision-making. This project is useful for learning real-world sales analysis and highlights the importance of data-driven insights in improving business performance and operational efficiency.
